Limitations of Neural Networks

Random initialization + densely connected networks lead to:

- High cost
 - Each neuron in the neural network can be considered as a logistic regression.
 - Training the entire neural network is to train all the interconnected logistic regressions.
- Difficult to train as the number of hidden layers increases
 - Recall that logistic regression is trained by gradient descent.
 - In backpropagation, gradient is progressively getting more dilute. That is, below top layers, the correction signal δ_n is minimal.
- Stuck in local optima
 - The objective function of the neural network is usually not convex.
 - The random initialization does not guarantee starting from the proximity of global optima.
- Solution:
 - Deep Learning/Learning multiple levels of representation

$f = w_1 x_1 + w_2 x_2 + b$
 $g = \text{sigmoid}(A)$
 $g = \frac{1}{1 + e^{-A}}$
 $y = g \{ \theta \}$
